

Assignment No.: 02

Problem Statement: Create MFA for Authentication.

Solution Process:

1. At first go to credentials security.

2. Then click the Assign MFA option.

3. Give the MFA device name and choose the Authenticator app.

The screenshot shows the AWS IAM console interface for the 'Assign MFA device' task. The breadcrumb trail is 'IAM > Security credentials > Assign MFA device'. On the left, a progress indicator shows 'Step 1: Select MFA device' as the current step and 'Step 2: Set up device' as the next step. The main content area is titled 'Select MFA device' with an 'Info' icon. It contains two sections: 'MFA device name' and 'MFA device'. The 'MFA device name' section has a text input field with 'madhu' entered, with a note that the name will be used in the ARN and a maximum length of 64 characters. The 'MFA device' section, under 'Device options', shows two radio buttons: 'Passkey or security key' (selected) and 'Authenticator app'. The 'Authenticator app' option is highlighted with a blue border and a plus icon.

4. Download the Authenticator app on our mobile.

5. Then scan the QR and Enter the MFA1 code from the Authenticator app.

6. Wait 30 seconds and Enter the MFA2 code from the Authenticator app.

The screenshot shows the 'Set up device' page in the AWS IAM console, specifically for an 'Authenticator app'. The breadcrumb trail is 'IAM > Security credentials > Assign MFA device'. The progress indicator on the left shows 'Step 1: Select MFA device' and 'Step 2: Set up device' as the current step. The main content area is titled 'Set up device' with an 'Info' icon. It contains a section 'Authenticator app' with instructions: 'A virtual MFA device is an application running on your device that you can configure by scanning a QR code.' There are three numbered steps: 1. 'Install a compatible application such as Google Authenticator, Duo Mobile, or Authy app on your mobile device or computer.' with a link to 'See a list of compatible applications'. 2. A QR code is displayed, with instructions to 'Open your authenticator app, choose Show QR code on this page, then use the app to scan the code. Alternatively, you can type a secret key. Show secret key'. 3. 'Type two consecutive MFA codes below.' with two input fields. The first field contains '949767' and the second field contains '474511'. At the bottom, there are three buttons: 'Cancel', 'Previous', and 'Add MFA'.

7. At last click on the Add MFA option.

8. Finally the MFA device is assigned.

The screenshot shows the AWS IAM console interface. At the top, a green notification banner states "MFA device assigned" with a close button. Below this, the "Multi-factor authentication (MFA) (1)" section is active, showing a table with one entry: a virtual MFA device with identifier "arn:aws:iam:491085397121:mfa/madhusree". To the right of the table are buttons for "Remove", "Resync", and "Assign MFA device". Below the MFA section, the "Access keys (0)" section is visible, showing a "Create access key" button. The left sidebar contains navigation links for Identity and Access Management (IAM), Access management, and Access reports.

MFA device assigned

You can register up to 8 MFA devices of any combination of the currently supported MFA types with your AWS account root and IAM user. With multiple MFA devices, you only need one MFA device to sign in to the AWS console or create a session through the AWS CLI with that user.

Multi-factor authentication (MFA) (1)

Use MFA to increase the security of your AWS environment. Signing in with MFA requires an authentication code from an MFA device. Each user can have a maximum of 8 MFA devices assigned. [Learn more](#)

Type	Identifier	Certifications	Created on
☐ Virtual	arn:aws:iam:491085397121:mfa/madhusree	Not Applicable	Wed Feb 19 2025

Access keys (0)

Use access keys to send programmatic calls to AWS from the AWS CLI, AWS Tools for PowerShell, AWS SDKs, or direct AWS API calls. You can have a maximum of two access keys (active or inactive) at a time. [Learn more](#)
